Teresa Romão

Month 09, 2026

- Problem:
  - People who share a household often struggle to coordinate chores, shared expenses, shopping, events, and important information. Existing solutions are usually fragmented across different applications, making household management less organized and collaborative.

- Target Users:
  - Families, couples, students, and roommates who share a household and need to coordinate their daily responsibilities and resources.

- Project goal:
  - Design and develop CoHabit, an interactive platform that centralizes household management, helping users coordinate chores, track shared expenses, manage shopping lists, organize household events, and communicate important information in one place.

- One application that competes with our proposed project is Flatastic. CoHabit improves the competitor's UI, is all for free, and add some usefull features like polls and bill splits… etc.
