The Bad - Betclick

The **home page** presents a large amount of information simultaneously, including featured events, promotions, live matches, betting suggestions, and advertisements. New users may find it difficult to identify where to start or locate the sport they are interested in. However, if you just take a second to play with it, it's not so bad. At least visually, the page does look good – it's just not that intuitive at first.

On the bottom left there is a little "fire" widget that also extends into more widgets. Sometimes I try to click on that button and accidentally click on a match beneath it. If you scroll down, both the bottom left and bottom right widgets will disappear, only reappearing if you scroll up for a while – quite inconvenient considering the "fire" widget contains other buttons like your current bets and other stuff.

The interface uses **many bright colors**, promotional banners, icons, and live-update indicators at the same time. While these elements are intended to attract attention and are indeed successful in doing so, their combined effect can be overwhelming.

Betting applications naturally rely on **numerical information**, but Betclic often displays large quantities of odds, statistics, scores, percentages, and match data simultaneously. For inexperienced users, the abundance of numbers can be exhausting.

At the end of the day, it's just a virtual casino, and the House wants the user to **spend as much as possible**. I understand their approach to put big numbers on bright colors that clearly stand-out. They do it for a reason, it is clearly effective.

What I'd Improve:

- I'd actually leave the **homepage as is**. It looks cool and contains only simple odds that most users will click. However, the bright color overlap is a bit much, so maybe I'd tone down the intensity and take a more conservative color pallet approach.

- On the **match interface** (after you click on a match to see more betting options), I would make the betting categories foldable. This way, users could just look for their preferred option without having a bunch of irrelevant numbers on screen.

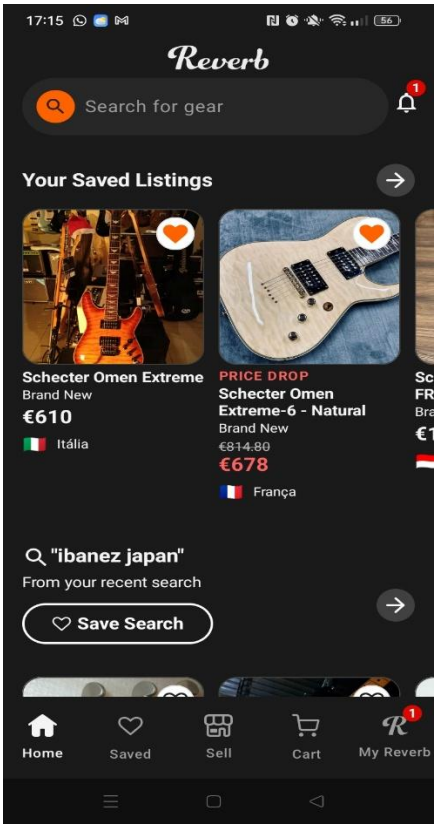

- Ironically, I'd bring some color into the **active bet page**. They seem to have spent it all on the home page, but left the active bet page dry. I guess they don't care anymore once you have actually put the money down. I'd use their signature red to very faintly outline each bet item/match/option, separating them more clearly.

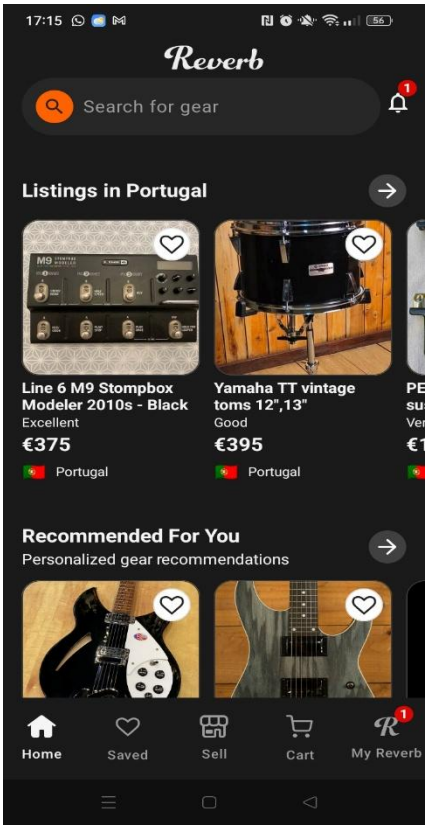

The Good - Reverb

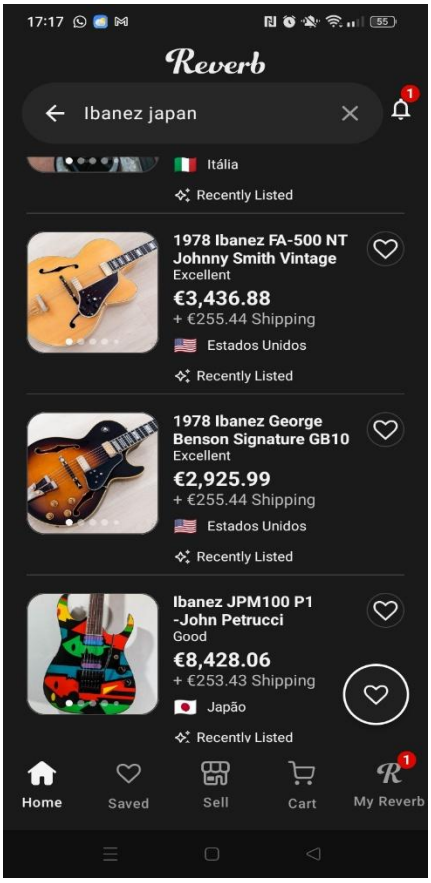

The Reverb **homepage** is well organized and easy to understand at first glance. The design focuses on helping users quickly find musical instruments and equipment without overwhelming them with unnecessary information. Categories, search tools, and featured products are presented in a clean layout, making navigation simple for any user.

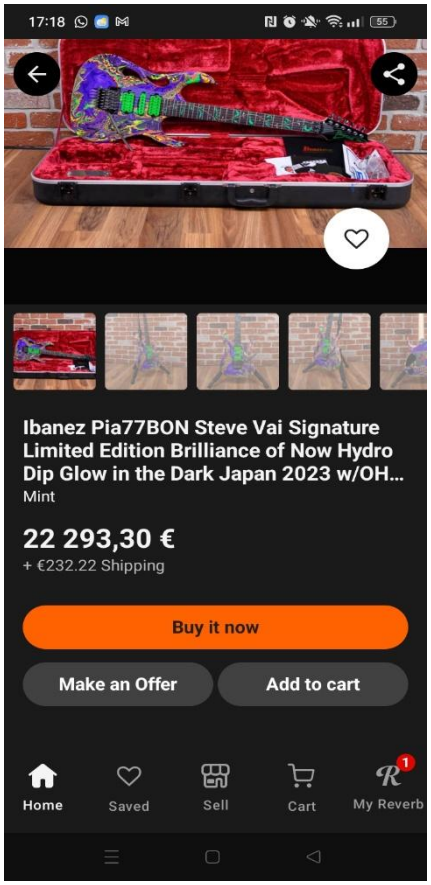

Product listings are easy to browse because each item clearly displays the most important information, such as the product name, price, condition, and photos.

Product pages follow a consistent structure, allowing users to quickly locate detailed descriptions, specifications, seller information, and shipping details. This reduces the effort required to compare products and make purchasing decisions.
